

# Human Complement C5 ELISA Kit

#### **Basic information:**

Catalog No.:UE1119Size:96TFor research use only. Not for diagnostic or therapeutic procedures.

## I. INTRODUCTION

C5a is a protein fragment released from complement component C5. This gene is mapped to 9q33.2. The protein encoded by this gene is the fifth component of complement, which plays an important role in inflammatory and cell killing processes. This protein is comprised of alpha and beta polypeptide chains that are linked by a disulfide bridge. An activation peptide, C5a, which is an anaphylatoxin that possesses potent spasmogenic and chemotactic activity, is derived from the alpha polypeptide via cleavage with a convertase. The C5b macromolecular cleavage product can form a complex with the C6 complement component, and this complex is the basis for formation of the membrane attack complex, which includes additional complement components. Mutations in this gene cause complement component 5 deficiency, a disease where patients show a propensity for severe recurrent infections. Defects in this gene have also been linked to susceptibility to liver fibrosis and to rheumatoid arthritis.

### **II. ASSAY PRINCIPLES**

The Gene Universal Human Complement C5 ELISA (Enzyme-Linked Immunosorbent Assay) kit is an in vitro enzyme-linked immunosorbent assay for the quantitative measurement of Human Complement C5 in Cell Culture Supernatants, Serum, Plasma. This assay employs an antibody specific for Human Complement C5 coated on a 96-well plate. Standards and samples are pipetted into the wells and Complement C5 present in a sample is bound to the wells by the immobilized antibody. The wells are washed and biotinylated anti-Human Complement C5 antibody is added. After washing away unbound biotinylated antibody, HRP-conjugated streptavidin is pipetted to the wells. The wells are again washed, a TMB substrate solution is added to the wells and color develops in proportion to the amount of Complement C5 bound. The Stop Solution changes the color from blue to yellow, and the intensity of the color is measured at 450 nm.

### III. STORAGE AND STABILITY

All kit components are stable at 2 to 8 °C. Standard (recombinant protein) should be stored at -20 °C or -80 °C (recommended at -80 °C) after reconstitution. Opened Microplate Wells or reagents may be store for up to 1 month at 2 to 8 °C. Return unused wells to the pouch containing desiccant pack, reseal along entire edge. Note: the kit can be used within one year if the whole kit is stored at -20 °C. Avoid repeated freeze-thaw cycles.

# IV. KIT COMPONENTS

Component	Volume
96-well Plate Coated With Anti-Human Complement C5 Antibody	12 x 8 Strips
Human Complement C5 Standard	2 ng x 2
Biotin-Labeled Detection Antibody (100X)	120 μl
Streptavidin-HRP (100X)	120 μl
Standard/Sample Diluent	30 ml
Detection Antibody Diluent	12 ml
Streptavidin-HRP Diluent	12 ml
Wash Buffer (20X)	30 ml
TMB Substrate Solution	12 ml
Stop Solution	12 ml
Plate Adhesive Strips	3 Strips
Technical Manual	1 Manual

# V. MATERIALS REQUIRED BUT NOT PROVIDED

- 1. Microplate reader capable of measuring absorbance at 450 nm.
- 2. Adjustable pipettes and pipette tips to deliver 2  $\mu l$  to 1 ml volumes.
- 3. Adjustable 1-25 ml pipettes for reagent preparation.
- 4. 100 ml and 1 liter graduated cylinders.
- 5. Absorbent paper.
- 6. Distilled or deionized water.
- 7. Computer and software for ELISA data analysis.
- 8. Tubes to prepare standard or sample dilutions.

# VI. HEALTH AND SAFETY PRECAUTIONS

1. Reagents provided in this kit may be harmful if ingested, inhaled or absorbed through the skin. Please carefully review the MSDS for each reagent before conducting the experiment.

2. Stop Solution contains 2 N Sulfuric Acid  $(H_2SO_4)$  and is an extremely corrosive agent. Please wear proper eye, hand and face protection when handling this material. When the experiment is finished, be sure to rinse the plate with copious amounts of running water to dilute the Stop Solution prior to disposing the plate.

## VII. REAGENT PREPARATION

### **1. Sample Preparation**

Store samples to be assayed within 24 hours at 2-8°C. For long-term storage, aliquot and freeze samples at -20°C. Avoid repeated freeze-thaw cycles.

**Cell culture supernates**: Remove particulates by centrifugation, assay immediately or aliquot and store samples at -20°C.

Efficient Professional Protein and Antibody Platforms

**Serum**: Allow the serum to clot in a serum separator tube (about 4 hours) at room temperature. Centrifuge at approximately 1000 X g for 15 minutes. Analyze the serum immediately or aliquot and store samples at -20°C.

**Plasma**: Collect plasma using heparin or EDTA as an anticoagulant. Centrifuge for 15 minutes at 1500 X g within 30 minutes of collection. Assay immediately or aliquot and store samples at -20°C.

**Cell Lysates:** Collect cells and rinse cells with PBS. Homogenize and lyse cells throughly in lysate solution. Centrifuge cell lysates at approximately 10000 X g for 5 minutes to remove debris. Aliquots of the cell lysates were removed and assayed. **Bone Tissue:** Extract demineralized bone samples in 4 M Guanidine-HCl and protease inhibitors. Dissolve the final sample in 2 M Guanidine-HCl.

**Tissue Homogenates:** Rinse tissue with PBS to remove excess blood, chopped into 1-2 mm pieces, and homogenize with a tissue homogenizer in PBS or in lysate solution, lysate solution: tissue net weight = 10ml : 1g (i.e. Add 10ml lysate solution to 1g tissue). Centrifuge at approximately 5000 X g for 5 minutes. Assay immediately or aliquot and store homogenates at -20°C. Avoid repeated freeze-thaw cycles. **Urine**: Urinary samples should be cleared by centrifugation and then can be used directly without dilution. Storage at -20°C.

### 2. Human Complement C5 Standard Preparation

Gene Universal

Reconstitute the lyophilized Human Complement C5 Standard by adding 1 ml of Standard/Sample Diluent to make the 2000 pg/ml standard stock solution. Allow solution to sit at room temperature for 5 minutes, then gently vortex to mix completely. Use within one hour of reconstituting. Two tubes of the standard (2 ng per tube) are included in each kit. Use one tube for each experiment.Perform 2-fold serial dilutions of the top standards to make the standard curve within the range of this assay (31.2 pg/ml - 2000 pg/ml) as below. Standard/Sample Dilution Buffer serves as the zero standard (0 pg/ml).

Standard	Add	Into
2000 pg/ml		
1000 pg/ml	500 $\mu l$ of the Standard (2000 pg/ml)	$500\mu l$ of the Standard/Sample Diluent
500 pg/ml	500 $\mu l$ of the Standard (1000 pg/ml)	500 $\mu l$ of the Standard/Sample Diluent
250 pg/ml	500 $\mu l$ of the Standard (500 pg/ml)	500 $\mu l$ of the Standard/Sample Diluent
125 pg/ml	500 $\mu l$ of the Standard (250 pg/ml)	500 $\mu l$ of the Standard/Sample Diluent
62.5 pg/ml	500 $\mu l$ of the Standard (125 pg/ml)	500 $\mu l$ of the Standard/Sample Diluent
31.25 pg/ml	500 $\mu l$ of the Standard (62.5 pg/ml)	500 $\mu l$ of the Standard/Sample Diluent
0 pg/ml	1 ml of the Standard/Sample Diluent	

**Note:** The standard solutions are best used within 2 hours. The 2000 pg/ml standard solution should be stored at 4°C for up to 12 hours, or at -20°C for up to 48 hours. Avoid repeated freeze-thaw cycles.

## 3. Biotin-Labeled Detection Antibody Working Solution Preparation

The Biotin-Labeled Detection Antibody should be diluted in 1:100 with the Detection Antibody Diluent and mixed thoroughly. The solution should be prepared no more than 2 hours prior to the experiment.

## 4. Streptavidin-HRP Working Solution Preparation

The Streptavidin-HRP should be diluted in 1:100 with the Streptavidin-HRP Diluent and mixed thoroughly. The solution should be prepared no more than 1 hour prior to the experiment.

## 5. Wash Buffer Working Solution Preparation

Pour entire contents (30 ml) of the Wash Buffer Concentrate into a clean 1,000 ml graduated cylinder. Bring final volume to 600 ml with glass-distilled or deionized water (1:20).

# VIII. ASSAY PROCEDURE

Gene Universal

The Streptavidin-HRP Working Solution and TMB Substrate Solution must be kept warm at 37°C for 30 minutes before use. When diluting samples and reagents, they must be mixed completely and evenly. Standard detection curve should be prepared for each experiment. The user will decide sample dilution fold by crude estimation of protein amount in samples.

1. Add 100  $\mu l$  of each standard and sample into appropriate wells.

2. Cover well and incubate for 90 minutes at room temperature or over night at 4°C with gentle shaking.

3. Remove the cover, discard the solution and wash plate 3 times with Wash Buffer Working Solution, and each time let Wash Buffer Working Solution stay in the wells for 1 - 2 minutes. Blot the plate onto paper towels or other absorbent material. Do NOT let the wells completely dry at any time.

4. Add 100  $\mu$ l of Biotin-Labeled Detection Antibody Working Solution into each well and incubate the plate at 37°C for 60 minutes.

5. Wash plate 3 times with Wash Buffer Working Solution, and each time let Wash Buffer Working Solution stay in the wells for 1 - 2 minutes. Discard the Wash Buffer Working Solution and blot the plate onto paper towels or other absorbent material. 6. Add 100  $\mu$ l of Streptavidin-HRP Working Solution into each well and incubate the plate at 37°C for 45 minutes.

7. Wash plate 5 times with Wash Buffer Working Solution, and each time let wash buffer stay in the wells for 1 - 2 minutes. Discard the wash buffer and blot the plate onto paper towels or other absorbent material.

8. Add 100  $\mu l$  of TMB Substrate Solution into each well and incubate plate at 37°C in dark for 30 minutes.

Efficient Professional Protein and Antibody Platforms

9. Add 100  $\mu l$  of Stop Solution into each well. The color changes into yellow immediately.

10. Read the O.D. absorbance at 450nm in a microplate reader within 30 minutes after adding the Stop Solution.

For calculation, (the relative O.D.450) = (the O.D.450 of each well) - (the O.D.450 of Zero well). The standard curve can be plotted as the relative O.D.450 of each standard solution (Y) vs. the respective concentration of the standard solution (X). The concentration of the samples can be interpolated from the standard curve. **Note:** If the samples measured were diluted, multiply the dilution factor to the concentrations from interpolation to obtain the concentration before dilution.

# IX. SENSITIVITY

Gene Universal

The minimum detectable dose of Human Complement C5 is typically less than 10 pg/ml.

# X. SPECIFICITY

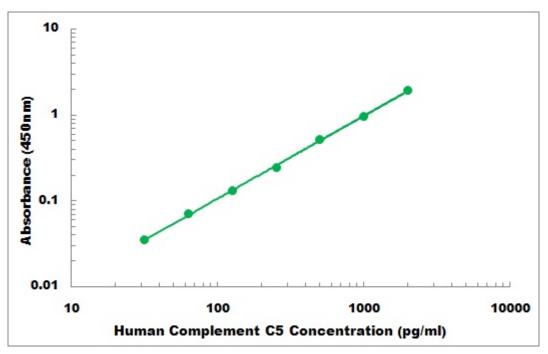

The Human Complement C5 ELISA Kit allows for the detection and quantification of endogenous levels of natural and/or recombinant Human Complement C5 proteins within the range of 31.2 pg/ml - 2000 pg/ml.

# XI. CROSS REACTIVITY

No detectable cross-reactivity with other relevant proteins.

## XII. TYPICAL DATA

The standard curve is for demonstration only. A standard curve must be run with each assay.

## XIII. ASSAY PROCEDURE SUMMARY

- Add 100 µl Standard or Sample
- Wash plate 3 times with Wash Buffer Working Solution
- Add 100 µl Biotin-Labeled Detection Antibody Working Solution
- Wash plate 3 times with Wash Buffer Working Solution
- $\bullet$  Add 100  $\mu I$  Streptavidin-HRP Working Solution
- Wash plate 5 times with Wash Buffer Working Solution
- Add 100 µl TMB Substrate Solution
- Add 100 µl Stop Solution
- Read the plate at 450nm

# XV. TROUBLESHOOTING GUIDE

Problem	Possible Cause	Solution
	<ul> <li>Insufficient washing</li> </ul>	<ul> <li>Increase number of washes</li> <li>Increase time of soaking between in wash</li> </ul>
High signal and background in	<ul> <li>Too much Streptavidin-HRP</li> </ul>	<ul> <li>Check dilution, titration</li> </ul>
all wells	<ul> <li>Incubation time too long</li> </ul>	<ul> <li>Reduce incubation time</li> </ul>
	• Development time too long	• Decrease the incubation time before the stop solution is added
No signal	• Reagent added in incorrect order, or incorrectly prepared	Review protocol
	<ul> <li>Standard has gone bad (If there is a signal in the sample wells)</li> </ul>	• Check the condition of stored standard
	<ul> <li>Assay was conducted from an incorrect starting point</li> </ul>	<ul> <li>Reagents allows to come to</li> <li>20 - 30 °C before performing</li> <li>assay</li> </ul>
Too much signal-whole plate turned uniformly blue	Insufficient washing-unbound Streptavidin-HRP remaining	<ul> <li>Increase number of washes</li> <li>Carefully</li> </ul>
	Too much Streptavidin-HRP	Check dilution
	• Plate sealer or reservoir reused, resulting in presence of residual Streptavidin-HRP	<ul> <li>Use fresh plate sealer and reagent reservoir for each step</li> </ul>
Standard curve achieved but poor discrimination between point	Plate not developed long enough	Increase substrate solution incubation time
	Improper calculation of standard curve dilution	Check dilution, make new standard curve
No signal when a signal is expected, but standard curve looks fine	<ul> <li>Sample matrix is masking detection</li> </ul>	<ul> <li>More diluted sample Recommended</li> </ul>
Samples are reading too high,	Samples contain protein levels	<ul> <li>Dilute samples and run</li> </ul>
but standard curve is fine	above assay range	Again
Edge effect	Uneven temperature around work surface	<ul> <li>Avoid incubating plate in areas where environmental conditions vary</li> <li>Use plate sealer</li> </ul>
